Overview

- Joint, marginal and conditional distributions for discrete variables
- Double integrals
- Joint, marginal and conditional distributions for continuous variables
- Independent variables
- Covariance and Correlation
- Conditional expectation

Joint distribution - discrete variables

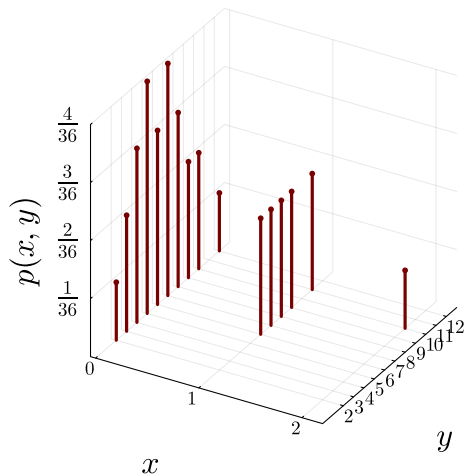

- Joint probability function for two discrete X and Y

$$p(x, y) = \Pr(X = x, Y = y)$$

- Example: Roll two dice.
 - X = the number of dice with 5
 - Y = sum of two dice

$X \backslash Y$	2	3	4	5	6	7	8	9	10	11	12
0	$\frac{1}{36}$	$\frac{2}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	$\frac{0}{36}$	$\frac{1}{36}$
1	0	0	0	0	$\frac{2}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	0	$\frac{2}{36}$	0
2	0	0	0	0	0	0	0	0	$\frac{1}{36}$	0	0

Joint distribution - discrete variables

Marginal distribution - discrete variables

- **Marginal distribution** $p_X(x)$ for X : probability distribution for X regardless of what happens to Y .

$$p_X(x) = \sum_{\text{all } y} p(x, y)$$

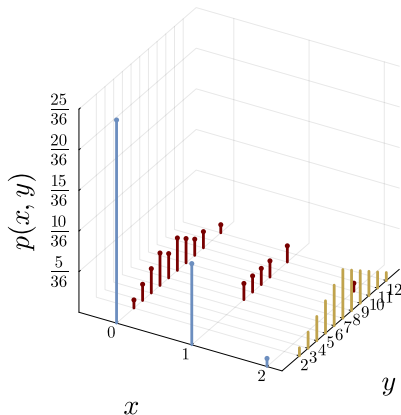

- **Marginal distribution** $p_Y(y)$ for Y

$$p_Y(y) = \sum_{\text{all } x} p(x, y)$$

$X \backslash Y$	2	3	4	5	6	7	8	9	10	11	12	$P_X(x)$
0	$\frac{1}{36}$	$\frac{2}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	0	$\frac{1}{36}$	$\frac{25}{36}$
1	0	0	0	0	$\frac{2}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	$\frac{2}{36}$	0	$\frac{2}{36}$	0	$\frac{10}{36}$
2	0	0	0	0	0	0	0	0	$\frac{1}{36}$	0	0	$\frac{1}{36}$
$p_Y(y)$	$\frac{1}{36}$	$\frac{2}{36}$	$\frac{3}{36}$	$\frac{4}{36}$	$\frac{5}{36}$	$\frac{6}{36}$	$\frac{5}{36}$	$\frac{4}{36}$	$\frac{3}{36}$	$\frac{2}{36}$	$\frac{1}{36}$	

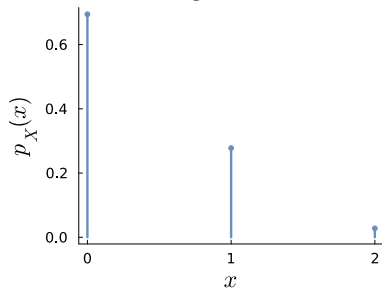

Marginal distribution - discrete variables

$$p_X(x) = \sum_y p(x, y) = \begin{cases} \frac{25}{36} & \text{for } x = 0 \\ \frac{10}{36} & \text{for } x = 1 \\ \frac{1}{36} & \text{for } x = 2 \end{cases} \quad (1)$$

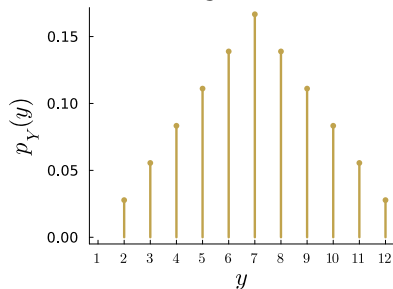

Marginal distribution - discrete variables

Marginal for X

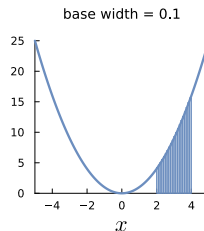

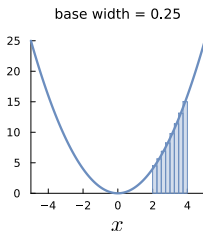

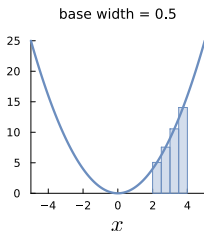

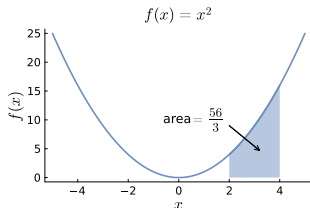

Marginal for Y

Single integral for function $f(x)$

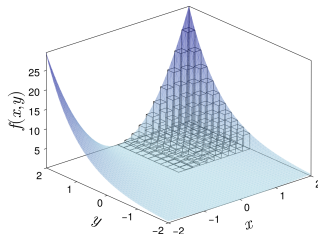

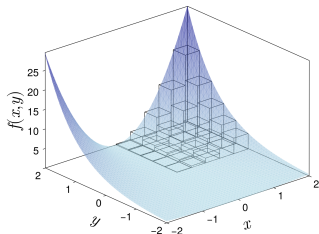

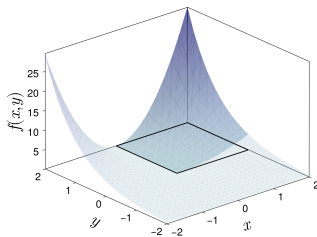

■ **Integral** = **area** under curve $y = f(x)$

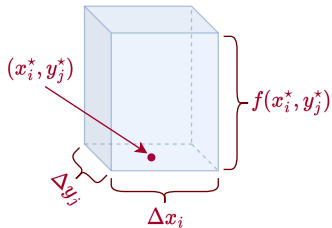

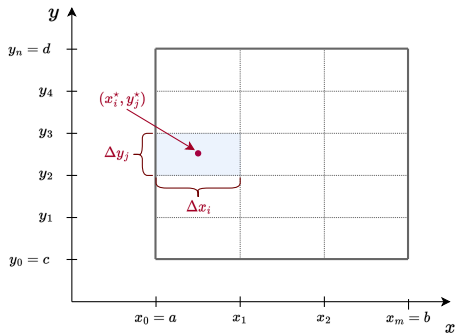

$$\sum_{i=1}^n f(x_i^*) \Delta x_i \rightarrow \int_a^b f(x) dx$$

Double integral for bivariate function $f(x, y)$

■ **Double integral** = **volume** under **surface** $z = f(x, y)$

Bivariate integrals

$$\sum_{i=1}^m \sum_{j=1}^n f(x_i^*, y_j^*) \Delta x_i \Delta y_j \rightarrow \int_a^b \int_c^d f(x, y) dx dy$$

Double integrals in action

■ Two-step approach:

- ▶ first integrate with respect to x while treating y as a constant
- ▶ then integrate with respect to y .

■ Example: $f(x, y) = x^2y$, integrate over $(x, y) \in (0, 1) \times (0, 1)$

$$\int_0^1 \int_0^1 x^2 y dx dy = \int_0^1 \left[\frac{1}{3} x^3 y \right]_0^1 dy = \int_0^1 \left(\frac{1}{3} y \right) dy = \left[\frac{1}{2 \cdot 3} y^2 \right]_0^1 = \frac{1}{6}$$

Double integrals - non-rectangular integration region

- Integration region may not be rectangular.
- $f(x, y) = x^2y$, integrate over triangular region:

$$(x, y) \in (0, 1) \times (0, 1) \quad \text{and } x \leq y$$

$$\int_0^1 \int_0^y x^2 y dx dy = \int_0^1 \left[\frac{1}{3} x^3 y \right]_0^y dy = \int_0^1 \left(\frac{1}{3} y^4 \right) dy = \left[\frac{1}{5 \cdot 3} y^5 \right]_0^1 = \frac{1}{15}$$

- General notation where R is some region in (x, y) -space

$$\iint_R f(x, y) dx dy$$

Joint cumulative distribution function

- **Joint cumulative distribution** for two random variables X and Y

$$F(x, y) = \Pr(X \leq x, Y \leq y)$$

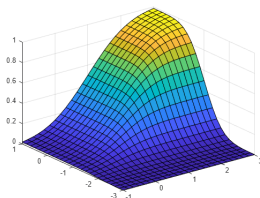

- Marginal distributions are special cases:

$$F(x, \infty) = \Pr(X \leq x, Y \leq \infty) = F_X(x)$$

$$F(\infty, y) = \Pr(X \leq \infty, Y \leq y) = F_Y(y)$$

- Other properties

$$F(-\infty, y) = F(x, -\infty) = F(-\infty, -\infty) = 0 \text{ and } F(\infty, \infty) = 1$$

Joint density function

- **Joint density function** for two random variables X and Y

$$f(x, y)$$

$$\Pr(a \leq X \leq b, c \leq Y \leq d) = \int_a^b \int_c^d f(x, y) dx dy$$

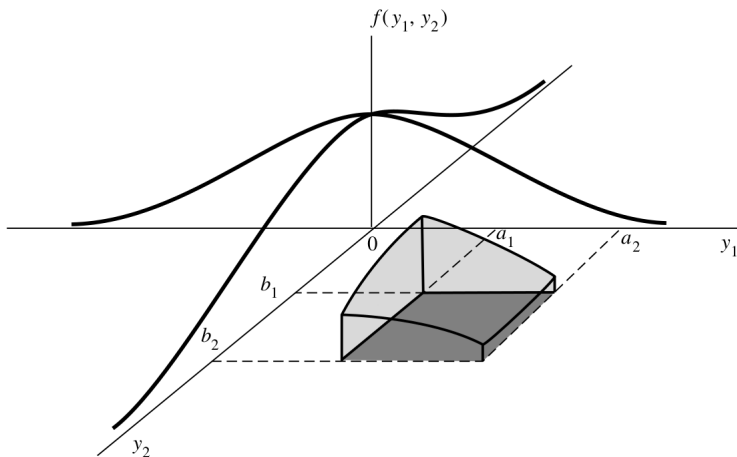

- Properties $f(x, y) \geq 0$ and

$$\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dx dy = 1$$

- Example: $f(x, y) = 6x^2y$

$$\begin{aligned} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} 6x^2y \, dx dy &= \int_{-\infty}^{\infty} \left[6x^2 \frac{1}{2} y^2 \right]_0^1 dx \\ &= \int_{-\infty}^{\infty} 3x^2 \, dx = [x^3]_0^1 = 1 \end{aligned}$$

Joint density function

Marginal distributions

- **Marginal density** for X

$$f_X(x) = \int_{-\infty}^{\infty} f(x, y) dy$$

- **Marginal density** for Y

$$f_Y(y) = \int_{-\infty}^{\infty} f(x, y) dx$$

- Example: $f(x, y) = 6x^2y$

$$\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) dx dy = 1$$

- Marginal density for X

$$f_X(x) = \int 6x^2y \, dy = \left[6x^2 \frac{1}{2} y^2 \right]_0^1 = 3x^2$$

- Marginal density for Y

Conditional distributions

- **Conditional probability events** for $\Pr(B) > 0$

$$\Pr(A|B) = \frac{\Pr(A \cap B)}{\Pr(B)}$$

- **Conditional distribution** of X given $Y = y$

$$p_{X|Y}(x|Y = y) = \frac{p(x, y)}{p_Y(y)}$$

- Continuous X and Y

$$f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)}$$

- Example: $f(x, y) = 6x^2y$ and $f_Y(y) = 2y$

$$f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)} = \frac{6x^2y}{2y} = 3x^2$$

Independent random variables

- Independent events if

$$\Pr(A|B) = \Pr(A)$$

alternatively

$$\Pr(A \cap B) = \Pr(A) \cdot \Pr(B)$$

- Knowing that B has occurred has no effect on my beliefs about A .
- Two random variables are **independent** if

$$p_{X|Y}(x|Y=y) = p_X(x)$$

alternatively

$$p(x, y) = p_X(x) \cdot p_Y(y)$$

- Example: $f(x, y) = 6x^2y$, with $f_X(x) = 3x^2$ and $f_Y(y) = 2y$.
 X and Y are independent since

$$f_X(x)f_Y(y) = 3x^2 \cdot 2y = 6x^2y = f(x, y)$$

Multivariate distributions

- **Joint probability density** for X_1, X_2, \dots, X_n

$$f(x_1, x_2, \dots, x_n)$$

- **Marginal distribution** for X_1

$$f_{X_1}(x_1) = \underbrace{\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty}}_{n-1 \text{ integrals}} f(x_1, x_2, \dots, x_n) \underbrace{dx_2 \cdots dx_n}_{\text{all except } dx_1}$$

- **Marginal distribution** for (X_1, X_2)

$$f_{X_1, X_2}(x_1, x_2) = \underbrace{\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \cdots \int_{-\infty}^{\infty}}_{n-2 \text{ integrals}} f(x_1, x_2, \dots, x_n) \underbrace{dx_3 \cdots dx_n}_{\text{all except } dx_1 \text{ and } dx_2}$$

- **Conditional distribution** for X_1

$$f(x_1 | X_2 = x_2, \dots, X_n = x_n) = \frac{f(x_1, x_2, \dots, x_n)}{f(x_2, \dots, x_n)}$$

Covariance and Correlation

- **Covariance** between X and Y

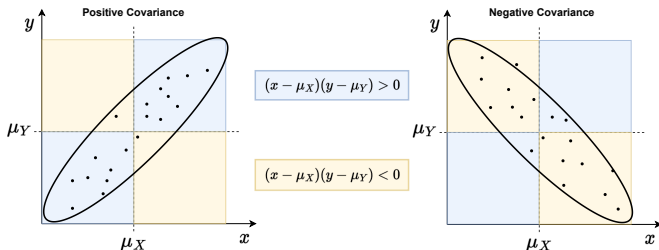

$$\text{Cov}(X, Y) = \mathbb{E}((X - \mu_X)(Y - \mu_Y))$$

where $\mu_X = \mathbb{E}(X)$ and $\mu_Y = \mathbb{E}(Y)$.

- **Correlation** between X and Y

$$\rho_{XY} = \frac{\text{Cov}(X, Y)}{\sigma_X \sigma_Y}$$

- **Covariance/Correlation** - measures **linear dependence**.

Conditional expectation

■ Conditional expectation

$$\mathbb{E}(X|Y = y) = \begin{cases} \sum_x x \cdot p(x|y) & \text{if } x \text{ and } y \text{ discrete} \\ \int x \cdot f(x|y) dx & \text{if } x \text{ and } y \text{ continuous} \end{cases}$$

- **Regression** and **classification** models the conditional expectation.

- Computing the expectation $\mathbb{E}(X)$ directly is sometimes hard.
- But the conditional expectation $\mathbb{E}(X|Y = y)$ may be simpler.
- Two-step approach:

- 1 Compute conditional expectation $\mathbb{E}(X|Y = y)$
- 2 Undo the conditioning on Y with \mathbb{E}_Y

■ Law of iterated expectation

$$\mathbb{E}(X) = \mathbb{E}_Y (\mathbb{E}_{X|Y}(X|Y))$$
